

Clarity.ai — Transparent Dating without guessing games

Concept & Vision

Clarity.ai is a clarity-first dating platform designed to remove ambiguity and improve compatibility. It replaces vague profiles and mixed signals with structured understanding, transparent matching, and guided interaction.

Who It Is For

Primary users: individuals aged 18–50 with ADHD, Autism, or AuDHD who struggle with ambiguity, indirect communication, and mismatch. Secondary users: neurotypical individuals who prefer clarity, directness, and structured communication.

Core Problem

Modern dating apps optimize for engagement and volume rather than compatibility and outcomes. This leads to miscommunication, poor matches, and emotional fatigue. Neurodivergent users are disproportionately affected.

Solution

Clarity.ai replaces ambiguity with structure. Users define communication style, energy, sensory preferences, and intent. This allows early filtering, better matching, and clearer expectations.

Onboarding Flow

Identity → Communication → Energy → Sensory → Routine → Intent → Profile Ready. Each step enforces clarity and structured data capture.

Matching System

Profile Data → Filter → Score → Explain → Display → Message. Matching prioritizes compatibility over volume and explains alignment and friction points.

NLP Strategy

NLP is used for summarization, clarity detection, contradiction detection, and moderation support. It does not infer diagnosis or personality. Outputs are descriptive and explainable.

Neurodivergent Challenges

Users face issues such as interpreting indirect cues, sensory overload, mismatch in expectations, and anxiety from unclear intent. Clarity.ai directly addresses these through structured communication.

Education Layer

The product includes embedded learning: communication styles, conflict awareness, emotional regulation, and relationship clarity. This improves long-term user outcomes.

Ethics & Trust

No manipulation loops, no psychological inference, no forced disclosure. Users control their data. The system is transparent and GDPR-aligned.

Technical Architecture

Frontend: React + Vite. Backend: Fastify. Shared schemas via Zod. Monorepo structure ensures consistency. AI is bounded and auditable.

Go-To-Market (Berlin)

Launch in Berlin with 500–1500 users within the Ring. Focus on density, quality matches, and organic growth through real outcomes.

Marketing Strategy

Community-first approach: Reddit, niche creators, local groups. Growth loop: better matches → better conversations → real dates → word-of-mouth.

Monetisation

Deferred. Future: premium filters, curated introductions, insights. Avoid pay-to-match and addictive patterns.

Why This Wins

Clarity.ai focuses on outcomes, not engagement. It delivers better matches, higher trust, and stronger retention.

Risks

Low-quality onboarding, misuse of AI, or insufficient density could limit success. Mitigation: iterate, constrain AI, and focus on early cohort quality.
